Santyl

Description

Santyl (collagenase)

Background

Santyl (collagenase) ointment is a sterile enzymatic debriding ointment which contains 250 collagenase units per gram of white petrolatum USP. The enzyme collagenase is derived from the fermentation by *Clostridium histolyticum*. It possesses the unique ability to digest collagen in necrotic tissue (1).

Regulatory Status

FDA-approved indication: Santyl ointment is indicated for debriding chronic dermal ulcers and severely burned areas (1).

Prior-Approval Requirements

Diagnoses

Patient must have **ONE** of the following:

1. Chronic dermal ulcer
2. Severely burned areas

AND ALL of the following:

- a. Documented presence of necrotic tissue, sinus tracts, exudation or infection of soft and hard tissues
- b. Prescriber agrees to terminate treatment when debridement of necrotic tissue is complete and granulation tissue is well established

Prior – Approval *Renewal* Requirements

Diagnoses

Patient must have **ONE** of the following:

1. Chronic dermal ulcer
2. Severely burned areas

AND ALL of the following:

- a. Improvement in wound
- b. Prescriber agrees to terminate treatment when debridement of necrotic tissue is complete and granulation tissue is well established

Quantity 360 grams per 90 days

Duration 3 months

Prior – Approval *Renewal* Limits

Same as above

Rationale

Summary

Santyl ointment is a sterile enzymatic debriding ointment which contains 250 collagenase units per gram of white petrolatum USP. The enzyme collagenase is derived from the fermentation by *Clostridium histolyticum*. It possesses the unique ability to digest collagen in necrotic tissue. Santyl ointment is indicated for debriding chronic dermal ulcers and severely burned areas. Use of Santyl ointment should be terminated when debridement is complete and granulation tissue is well established (1).

Prior authorization is required to ensure the safe, clinically appropriate, and cost-effective use of Santyl ointment while maintaining optimal therapeutic outcomes.
