Kadcyla

Description

Kadcyla (ado-trastuzumab emtansine)

Background

Kadcyla (ado-trastuzumab emtansine) is indicated for HER2-positive breast cancer. Kadcyla is a monoclonal antibody that targets and inhibits HER-2 receptor signaling. Kadcyla inhibits shedding of the HER2 extracellular domain in human breast cancer cells that overexpress HER2. Kadcyla binds to HER-2 receptors and undergoes internalization, which in turn releases cytotoxic catabolites that disrupt microtubule networks in the cell resulting in cell cycle arrest and apoptotic cell death (1).

Regulatory Status

FDA approved indications: (1)

Kadcyla is a HER2-targeted antibody and microtubule inhibitor conjugate indicated, as a single agent, for:

- The treatment of patients with HER2-positive, metastatic breast cancer who previously received trastuzumab and a taxane, separately or in combination. Patients should have either:
 - Received prior therapy for metastatic disease, or
 - Developed disease recurrence during or within 6 months of completing adjuvant therapy.
- The adjuvant treatment of patients with HER2-positive early breast cancer who have residual invasive disease after neoadjuvant taxane and trastuzumab-based treatment.

Subsection:	Antineoplastic Agents	Original Policy Date:	April 15, 2013
Subject:	Kadcyla	Page:	2 of 5

Kadcyla has a boxed warning citing the risk of hepatotoxicity, cardiac toxicity, and embryo-fetal toxicity. Serious hepatotoxicity has been reported, including liver failure and death in patients treated with Kadcyla. Serum transaminases and bilirubin levels should be obtained prior to initiation of treatment and prior to each dose. Kadcyla administration may lead to reductions in left ventricular ejection fraction (LVEF). Patients should be evaluated for left ventricular ejection fraction prior to and during treatment with Kadcyla (1).

Kadcyla can result in embryo-fetal harm when administered during pregnancy. Female patients of reproductive potential should be advised to use effective contraception during treatment and for 7 months following the last dose. Because of the potential for genotoxicity, male patients with female partners of reproductive potential should be advised to use effective contraception during treatment with Kadcyla and for 4 months following the last dose (1).

Kadcyla has warnings and precautions regarding pulmonary toxicity, infusion related reactions, hypersensitivity reactions, hemorrhage, thrombocytopenia, and neurotoxicity. Kadcyla should be discontinued in patients who develop interstitial lung disease (ILD) or pneumonitis. Kadcyla may cause thrombocytopenia and platelet counts should be monitored prior to initiation of therapy and prior to each dose (1).

Treatment with Kadcyla has not been studied in patients who had trastuzumab permanently discontinued due to infusion-related reactions (IRR) and/or hypersensitivity. Treatment with Kadcyla is not recommended for these patients. Patients should be observed closely for IRR reactions, especially during the first infusion (1).

Safety and effectiveness in pediatric patients have not been established (1).

Policy

This policy statement applies to clinical review performed for pre-service (Prior Approval, Precertification, Advanced Benefit Determination, etc.) and/or post-service claims.

Kadcyla may be considered **medically necessary** in patients 18 years of age or older with HER2-positive breast cancer and if the conditions indicated below are met.

Kadcyla may be considered **investigational** in patients less than 18 years of age and for all other indications.

Section:	Prescription Drugs	Effective Date:	July 1, 2022
Subsection:	Antineoplastic Agents	Original Policy Date:	April 15, 2013
Subject:	Kadcyla	Page:	3 of 5

Prior-Approval Requirements

Age 18 years of age or older

Diagnosis

Patient must have **ONE** of the following:

1. HER2-positive metastatic breast cancer
 - a. Received prior therapy with trastuzumab or trastuzumab with a taxane
OR
 - b. Developed disease recurrence during or within six months of completing adjuvant therapy
2. HER2-positive early breast cancer
 - a. Patient has residual invasive disease after neoadjuvant taxane and trastuzumab-based treatment

AND ALL of the following:

- a. Hepatic function and platelet counts monitored prior to initiation and prior to receiving each dose
- b. Left ventricular ejection fraction (LVEF) monitored prior to initiation and every three months during treatment
- c. Prescriber agrees to advise female patients of reproductive potential to use effective contraception during treatment and for 7 months following the last dose
- d. Prescriber agrees to monitor for pulmonary toxicity

Prior – Approval *Renewal* Requirements

Age 18 years of age or older

Diagnosis

Patient must have the following:

1. HER2-positive breast cancer

AND ALL of the following:

Section:	Prescription Drugs	Effective Date:	July 1, 2022
Subsection:	Antineoplastic Agents	Original Policy Date:	April 15, 2013
Subject:	Kadcyla	Page:	4 of 5

- a. Patient has not been diagnosed with nodular regenerative hyperplasia (NRH)
- b. Hepatic function, LVEF and platelet count monitored prior to each dose
- c. Prescriber agrees to advise female patients of reproductive potential to use effective contraception during treatment and for 7 months following the last dose
- d. Prescriber agrees to monitor for pulmonary toxicity

Policy Guidelines

Pre - PA Allowance

None

Prior - Approval Limits

Duration 12 months

Prior – Approval *Renewal* Limits

Same as above

Rationale

Summary

Kadcyla (ado-trastuzumab emtansine) is indicated for HER2-positive breast cancer. Kadcyla is a monoclonal antibody that inhibits the HER2 receptor signaling and mediates antibody-dependent cell-mediated cytotoxicity. This inhibits the shedding of the HER2 extracellular domain in overexpressing HER2 breast cancer cells. Kadcyla carries a boxed warning citing the risk of hepatotoxicity, cardiac toxicity, and embryo-fetal toxicity. Kadcyla has warnings and precautions regarding pulmonary toxicity, infusion related reactions, hypersensitivity reactions, hemorrhage, thrombocytopenia and neurotoxicity. The safety and efficacy of Kadcyla in pediatric patients have not been established (1).

Prior approval is required to ensure the safe, clinically appropriate and cost-effective use of Kadcyla while maintaining optimal therapeutic outcomes.
