Flolan Veletri

Description

Flolan, Veletri (epoprostenol)

Background
Pulmonary arterial hypertension is a rare disorder of the pulmonary arteries in which the pulmonary arterial pressure rises above normal levels in the absence of left ventricular failure. This condition can progress to cause right-sided heart failure and death (1). Epoprostenol is indicated for treatment of pulmonary arterial hypertension (PAH) which is classified by WHO as Group 1. Epoprostenol is used to treat pulmonary arterial hypertension (PAH, high blood pressure in the lungs) to improve exercise ability (1-2).

The World Health Organization (WHO) has classified pulmonary hypertension into five different groups: (3)

**WHO Group 1: Pulmonary Arterial Hypertension (PAH)**

1.1 Idiopathic (IPAH)
1.2 Heritable PAH
   - 1.2.1 Germline mutations in the bone morphogenetic protein receptor type 2 (BMPR2)
   - 1.2.2 Activin receptor-like kinase type 1 (ALK1), endoglin (with or without hereditary hemorrhagic telangiectasia), Smad 9, caveolin-1 (CAV1), potassium channel super family K member-3 (KCNK3)
   - 1.2.3 Unknown
1.3 Drug-and toxin-induced
1.4 Associated with:
   - 1.4.1 Connective tissue diseases
1.4.2 HIV infection
1.4.3 Portal hypertension
1.4.4 Congenital heart diseases
1.4.5 Schistosomiasis
1'. Pulmonary vena-occlusive disease (PVOD) and/or pulmonary capillary hemangiomatosis (PCH)
1". Persistent pulmonary hypertension of the newborn (PPHN)

The diagnosis of WHO Group 1 PAH requires a right heart catheterization to demonstrate an mPAP ≥ 20mmHg at rest and a pulmonary vascular resistance (PVR) ≥ 3 Wood units, mean pulmonary capillary wedge pressure ≤ 15mmHg (to exclude pulmonary hypertension due to left heart disease, i.e. WHO Group 2 pulmonary hypertension) (5-7).

**WHO Group 2: Pulmonary Hypertension Owing to Left Heart Disease**

2.1 Systolic dysfunction
2.2 Diastolic dysfunction
2.3 Valvular disease
2.4 Congenital/acquired left heart inflow/outflow tract obstruction and congenital cardiomyopathies

**WHO Group 3: Pulmonary Hypertension Owing to Lung Disease and/or Hypoxia**

3.1 Chronic obstructive pulmonary disease
3.2 Interstitial lung disease
3.3 Other pulmonary diseases with mixed restrictive and obstructive pattern
3.4 Sleep-disordered breathing
3.5 Alveolar hypoventilation disorders
3.6 Chronic exposure to high altitude
3.7 Developmental abnormalities

**WHO Group 4: Chronic Thromboembolic Pulmonary Hypertension <CTEPH>**

**WHO Group 5: Pulmonary Hypertension with Unclear Multifactorial Mechanisms**

5.1 Hematologic disorders: Chronic hemolytic anemia, myeloproliferative disorders, splenectomy
5.2 Systemic disorders: sarcoidosis, pulmonary Langerhans cell histiocytosis: lymphangioleiomyomatosis, neurofibromatosis, vasculitis
5.3 Metabolic disorders: glycogen storage disease, Gaucher's disease, thyroid disorders
The American College of Chest Physicians (ACCP) has published an updated clinical practice guideline for treating PAH. These guidelines use the New York Heart Association (NYHA) functional classification of physical activity scale to classify PAH patients in classes I-IV based on the severity of their symptoms (4). Epoprostenol is indicated for patients with NYHA Functional Class III or IV (1-2).

### Regulatory Status

FDA-approved indication: Epoprostenol is indicated for the treatment of pulmonary arterial hypertension (PAH) (WHO Group 1) to improve exercise capacity. Studies establishing effectiveness included predominantly (97%) patients with NYHA Functional Class III-IV symptoms and etiologies of idiopathic or heritable PAH (49%) or PAH associated with connective tissue diseases (51%) (1-2).

Some patients with pulmonary hypertension have developed pulmonary edema during dose initiation, which may be associated with pulmonary veno-occlusive disease. Epoprostenol should not be used chronically in patients who develop pulmonary edema during dose initiation (1-2).

Epoprostenol is associated with a variety of adverse effects, many of which can be dose-limiting such as hypotension, nausea, vomiting, flushing, and headache. Hemorrhage, thrombocytopenia, and sepsis have also been reported (1-2).
Epoprostenol is contraindicated in patients with heart failure caused by reduced left ventricular ejection fraction (1-2).

Policy
This policy statement applies to clinical review performed for pre-service (Prior Approval, Precertification, Advanced Benefit Determination, etc.) and/or post-service claims.

Flolan and Veletri may be considered medically necessary for patients 18 years of age and older with primary pulmonary hypertension, WHO Group 1 and if the conditions indicated below are met.

Flolan and Veletri may be considered investigational in patients less than 18 years of age and for all other indications.

Prior-Approval Requirements

Age
18 years of age or older

Diagnoses

Patient must have BOTH of the following

1. Pulmonary Arterial Hypertension (PAH) - WHO Group I

2. NYHA functional classification of physical activity - Class III or IV

AND ALL of the following:

a. NO congestive heart failure (CHF) due to severe left ventricular systolic dysfunction

b. Prescribed by or recommended by a cardiologist or pulmonologist

c. Prescriber agrees to monitor for pulmonary edema and discontinue if confirmed

Prior – Approval Renewal Requirements
Age 18 years of age or older

Diagnoses

Patient must have the following

1. Pulmonary Arterial Hypertension (PAH) - WHO Group I

AND ALL of the following:
   a. Symptoms have improved or stabilized
   b. NO congestive heart failure (CHF) due to severe left ventricular systolic dysfunction
   c. Prescriber agrees to monitor for pulmonary edema and discontinue if confirmed

Policy Guidelines

Pre - PA Allowance
None

Prior - Approval Limits
Duration 2 years

Prior – Approval Renewal Limits
Same as above

Rationale

Summary
Pulmonary arterial hypertension is a rare disorder of the pulmonary arteries in which the pulmonary arterial pressure rises above normal levels in the absence of left ventricular failure. This condition can progress to cause right-sided heart failure and death. Epoprostenol is indicated for the treatment of pulmonary arterial hypertension (PAH) (WHO Group 1) and NYHA functional class III or IV to improve exercise capacity (1-2).

Prior authorization is required to ensure the safe, clinically appropriate and cost-effective use of Flolan/Veletri while maintaining optimal therapeutic outcomes.
