Bosulif

Description

Bosulif (bosutinib)

Background
Bosulif (bosutinib) is indicated for the treatment of chronic myelogenous leukemia (CML), a blood and bone marrow disease that usually affects older adults. Bosulif is intended for patients with chronic, accelerated or blast phase Philadelphia chromosome positive CML who are resistant to or who cannot tolerate other therapies, including imatinib. Bosulif works by blocking the signal of the tyrosine kinase that promotes the development of abnormal and unhealthy granulocytes. Most people with CML have a genetic mutation, called the Philadelphia chromosome, which causes the bone marrow to make an enzyme called tyrosine kinase. This enzyme triggers the development of too many abnormal and unhealthy white blood cells called granulocytes. Granulocytes fight infection (1-2).

Regulatory Status
FDA-approved indication: Bosulif is a kinase inhibitor indicated for the treatment of adult patients with: (1)
   1. Newly-diagnosed chronic phase Ph+ chronic myelogenous leukemia (CML)
   2. Chronic, accelerated, or blast phase Ph+ chronic myelogenous leukemia (CML) with resistance or intolerance to prior therapy

Off-Label Uses: (2-4)
   1. Treatment of patients with advanced phase CML (accelerated phase or blast phase)
   2. Follow-up therapy for CML patients after hematopoietic stem cell transplant (HSCT)
3. Relapsed or refractory Philadelphia chromosome positive acute lymphoblastic leukemia (Ph+ ALL)

Bosulif has warnings and precautions regarding gastrointestinal toxicity, myelosuppression, hepatic toxicity, fluid retention and embryo-fetal toxicity. Patients should be monitored and managed using standards of care. Therapy should be interrupted, the dose reduced or discontinued as necessary (1).

Liver enzymes should be monitored at least monthly for the first 3 months and as needed. Thrombocytopenia, anemia and neutropenia can occur; therefore, a complete blood count should be performed weekly for the first month and then monthly or as clinically indicated (1).

The safety and efficacy of Bosulif in patients less than 18 years of age have not been established (1).

**Related policies**
Gleevec, Iclusig, Sprycel, Tasigna

**Policy**
This policy statement applies to clinical review performed for pre-service (Prior Approval, Precertification, Advanced Benefit Determination, etc.) and/or post-service claims.

Bosulif may be considered medically necessary in patients that are 18 years of age or older with a confirmed diagnosis of newly-diagnosed chronic phase Ph+ chronic myelogenous leukemia (CML); or chronic, accelerated, or blast phase Ph+ chronic myelogenous leukemia (CML); or chronic myeloid leukemia (CML) post hematopoietic stem cell transplant (HSCT); Ph+ acute lymphoblastic leukemia (ALL); and if the conditions indicated below are met.

Bosulif is considered investigational in patients that are less than 18 years of age and for all other indications.

**Prior-Approval Requirements**

**Age**
18 years of age and older

**Diagnoses**

Patient must have ONE of the following:
1. Newly-diagnosed chronic phase Ph+ chronic myelogenous leukemia (CML)

2. Chronic phase Ph+ chronic myelogenous leukemia (CML)
   a. Resistance or intolerance to prior therapy with one or more tyrosine kinase inhibitors

3. Accelerated phase Ph+ chronic myelogenous leukemia (CML)

4. Blast phase Ph+ chronic myelogenous leukemia (CML)

5. Chronic myeloid leukemia (CML) post hematopoietic stem cell transplant (HSCT)

6. Relapsed or refractory Ph+ acute lymphoblastic leukemia (ALL)

**AND** the following for **ALL** indications:

1. Confirmed by detection of the Ph chromosome or BCR-ABL gene by cytogenetic and/or molecular testing prior to initiation of therapy

2. If the patient has had prior therapy with a TKI then **ONE** of the following requirements must be met:
   a. Member experienced resistance to prior therapy with TKI
      i. Results from mutational testing are negative for the T315I mutation
   b. Member experienced toxicity or intolerance to prior therapy with a TKI

3. No dual therapy with another tyrosine kinase inhibitor

**Prior – Approval Renewal Requirements**

**Age**
18 years of age and older

**Diagnoses**

Patient must have **ONE** of the following:

1. Ph+ Chronic myelogenous leukemia (CML)
2. Chronic myeloid leukemia (CML) post hematopoietic stem cell transplant (HSCT)
3. Relapsed or refractory Ph+ acute lymphoblastic leukemia (ALL)

**AND** the following for **ALL** indications:
a. NO dual therapy with another tyrosine kinase inhibitor

**Policy Guidelines**

**Pre - PA Allowance**

None

**Prior - Approval Limits**

**Quantity**

</tbody>
</table>

*Maximum daily limit of any combination: 600 mg*

* Quantity limits listed above must be used to achieve dose optimization

**Utilizing the highest strengths available to achieve the dosage is recommended to minimize dosing errors and improve compliance**

**Duration**

12 months

**Prior – Approval Renewal Limits**

Same as above

**Rationale**

**Summary**

Bosulif (bosutinib) is a kinase inhibitor that inhibits the BCR-ABL kinase, an enzyme that promotes chronic myelogenous leukemia (CML). In studies, treatment with bosutinib reduced the size of CML tumors relative to controls and inhibited growth of murine myeloid tumors expressing several Gleevec (imatinib)-resistant forms of BCR-ABL (1).

Prior approval is required to ensure the safe, clinically appropriate and cost effective use of Bosulif while maintaining optimal therapeutic outcomes.
