Gamifant

Description

Gamifant (emapalumab-Izsg)

Background
Hemophagocytic lymphohistiocytic (HLH) most frequently affects infants from birth to 18 months of age, but can also affect children and adults of all ages. It is an aggressive and life-threatening syndrome characterized by excessive inflammation and tissue destruction due to abnormal immune activation. Unregulated activation of immune cells (macrophages, NK cells, CTLs) result in hypersecretion of interferon gamma (IFNγ). Gamifant (emapalumab-Izsg) is a monoclonal antibody that binds to and neutralizes interferon gamma (IFNγ), which plays a pivotal role in the pathogenesis of HLH by being hypersecreted (1-2).

Regulatory Status
FDA-approved indication: Gamifant is an interferon gamma (IFNγ) blocking antibody indicated for the treatment of: (2)

1. Adult and pediatric (newborn and older) patients with primary hemophagocytic lymphohistiocytosis (HLH) with refractory, recurrent or progressive disease or intolerance with conventional HLH therapy

Testing should be done for latent tuberculosis infections using the purified protein derivative (PPD) or IFNγ release assay and patients should be evaluated for tuberculosis risk factors prior to initiating Gamifant. Tuberculosis prophylaxis should be administered to patients at risk for tuberculosis, or known to have a positive PPD test result, or positive IFNγ release assay (2).
Patients should be monitored for tuberculosis, adenovirus, Epstein-Barr virus (EBV), and cytomegalovirus (CMV) every 2 weeks and as clinically indicated (2).

Prophylaxis should be administered for Herpes Zoster, *Pneumocystis jirovecii*, and for fungal infections prior to Gamifant administration. For patients who are not receiving baseline dexamethasone treatment, dexamethasone should be started at a daily dose of at least 5 to 10 mg/m² the day before Gamifant treatment begins. For patients who were receiving baseline dexamethasone, they may continue their regular dose provided the dose is at least 5 mg/m². Dexamethasone can be tapered according to the judgment of the treating physician (2).

Gamifant may increase the risk of fatal and serious infections to include specific pathogens favored by IFNγ neutralization, including mycobacterium, Herpes Zoster virus, and *Histoplasma capsulatum*. Patients receiving Gamifant should be closely monitored for signs and symptoms or infection and a complete diagnostic workup and appropriate antimicrobial therapy should be initiated. Patients should not be given live or live attenuated vaccines during therapy and for at least 4 weeks after the last dose of Gamifant (2).

Safety and effectiveness of Gamifant have been established in pediatric patients, newborn and older, with primary HLH that is reactivated or refractory to conventional therapies (2).

**Related policies**

This policy statement applies to clinical review performed for pre-service (Prior Approval, Precertification, Advanced Benefit Determination, etc.) and/or post-service claims.

Gamifant may be considered medically necessary in patients with primary hemophagocytic lymphohistiocytosis (HLH) and if the conditions indicated below are met.

Gamifant is considered investigational for all other indications.

**Prior-Approval Requirements**

**Diagnosis**

Patients must have the following:

1. Primary hemophagocytic lymphohistiocytosis (HLH)
a. The diagnosis has been confirmed by genetic testing or using clinical findings, including lab tests and symptoms (see Appendix 1)

AND ALL of the following:
1. Will be given concurrently with dexamethasone
2. Patient has had an inadequate response, intolerance, or contraindication to at least ONE of the following:
   a. Etoposide
   b. Cyclosporine A
   c. Anti-thymocyte globulin
3. Prescriber agrees to monitor for tuberculosis, adenovirus, EBV, and CMV
4. Absence of active infection
5. NOT given concurrently with live or live attenuated vaccines

Prior – Approval Renewal Requirements

Diagnosis
Patients must have the following:

1. Primary hemophagocytic lymphohistiocytosis (HLH)

   AND ALL of the following:
   1. Will be given concurrently with dexamethasone
   2. Hematopoietic stem cell transplantation (HSCT) has NOT been performed
   3. NO unacceptable toxicity
   4. Prescriber agrees to monitor for tuberculosis, adenovirus, EBV, and CMV
   5. Absence of active infection
   6. NOT given concurrently with live or live attenuated vaccines
Prior - Approval Limits

Duration  12 months

Prior – Approval *Renewal* Limits
Same as above

**Rationale**

**Summary**
Gamifant (Emapalumab-lzsg) is a monoclonal antibody that binds to and neutralizes interferon gamma (IFNγ), which is thought to play a major role in pathogenesis of hemophagocytic lymphohistiocytosis. Safety and effectiveness of Gamifant have been established in pediatric patients, newborn and older, with primary HLH that is reactivated or refractory to conventional therapies (2).

Prior authorization is required to ensure the safe, clinically appropriate and cost-effective use of Gamifant while maintaining optimal therapeutic outcomes.

This policy was approved by the FEP® Pharmacy and Medical Policy Committee on
June 20, 2019 and is effective on July 1, 2019.
Appendix 1 - List of Diagnostic Criteria for HLH

1. Fever (≥38.5°C)
2. Splenomegaly
3. Peripheral blood cytopenias defined as at least two of the following:
   a. Hemoglobin < 9 g/dL (infants less than 4 weeks of age < 10 g/dL)
   b. Platelets < 100 x 10⁹/L
   c. Neutrophils < 1.0 x 10⁹/L
4. Hypertriglyceridemia or hypofibrinogenemia defined by one of the following:
   a. Fasting triglycerides ≥2.0 mmol/L or > 3 SD of the normal value for age
   b. Fibrinogen ≤1.5 g/L
5. Hemophagocytosis in bone marrow, spleen, or lymph nodes
6. Low or absent natural killer cell activity
7. Ferritin ≥500 mcg/L
8. Soluble CD25 (soluble IL2Ra) ≥2400 U/mL
